EWG's 14th annual analysis of sunscreens includes hazard and efficacy ratings for more than 730 sunscreens, 460 SPF-labeled moisturizers and more than 100 lip products. The ratings are based on an in-house compilation of standard industry, government and academic data sources; models we constructed over the past 14 years; and a thorough review of the technical literature on sunscreens.

Background. Infrared radiation (IR) exposure generates reactive oxygen species and induces matrix metalloproteinase-1 expression in human skin. Moreover, while not as acute as ultraviolet radiation, repeated infrared irradiation can result in the photoaging of skin.

# Download Free Evaluation Of Sunscreen Products

Broad-spectrum sunscreens can protect skin from IR, but no human in vivo test methods for the evaluation of sunscreens' IR protection effect have been developed.

sunscreen products in Australia, the USA and Europe do not require photostability testing, as per the International Conference on Harmonisation (ICH) Guideline Q1B for new drug substances and drug products. During UV-irradiation on exposure to sunlight, there is potential for chemical UV-filters to degrade by direct photolysis.
