Stereochemistry In Organic Compounds
About this unit Just like how your left foot doesn't quite fit your right shoe, molecules also can have properties that depend on their handedness! This property is called chirality. We will go over what makes a molecule chiral, stereoisomers, assigning configurations using the R,S system, optical activity and Fischer projections.

Stereochemistry is an important aspect of Organic Chemistry, by Sangeetha on 20-06-2019. Chemistry: Stereochemistry is rarely an issue in ortholithiation reactions unless the directing group is chiral and a prochiral electrophile is used which gives rise to a new stereogenic centre. Stereochemistry: Stereochemistry is an important aspect of Organic Chemistry and you must be able to draw structures which clearly indicate the stereochemical orientation of the various groups on a molecule.

Structure, Reactivity and Stereochemistry of Organic Compounds
Stereoisomers- Compounds that have the same molecular formula and the same connectivity, but different arrangement of the atoms in 3-dimensional space. Stereoisomers cannot be converted into each other without breaking bonds. Enantiomers- Non-superposable mirror images, or chiral molecules which are mirror images.

SUPPLEMENTARY NOTES FOR STEREOCHEMISTRY
Stereochemistry is the branch of chemistry that involves " the study of the different spatial arrangements of atoms in molecules ". Stereochemistry is the systematic presentation of a specific field of science and technology traditionally requires a short preliminary excursion into history. Stereochemistry is the " chemistry of space ", that is stereochemistry deals with the spatial arrangements of atoms and groups in a molecule.

Stereochemistry - Chirality, Enantiomers & Diastereomers ...
An important branch of stereochemistry is the study of chiral molecules. Stereochemistry spans the entire spectrum of organic, inorganic, biological, physical and especially supramolecular chemistry. Stereochemistry includes methods for determining and describing these relationships; the effect on the physical or biological properties these relationships impart upon the molecules in question, and the manner in which these relationships influence the reactivity of the molecules in question (...

The term " stereochemistry " is derived from the Greek " stereos " meaning solid—it refers to chemistry in three dimensions. Since nearly all organic molecules are three dimensional (with the exception of some olefins and aromatics to be discussed later), stereochemistry cannot be considered a branch of chemistry.

35. A meso compound is a molecule with multiple stereocenters that is superimposable on its mirror image. Meso compounds are achiral compounds that has multiple chiral centers. Meso compounds are optically inactive. It has an internal symmetry plane that divides the compound in half.
